

ABSTRACT

A pixel selecting TFT is made of a polysilicon TFT, in which a gate insulating layer is formed on an active layer made of a polysilicon layer formed on a transparent insulating substrate made of a glass substrate or the like, and two gates extend from a gate signal line. A

- 5 driving TFT is made of an amorphous silicon TFT, in which a gate insulating layer is formed on an active layer made of an amorphous silicon layer formed on the transparent insulating substrate, and a gate made of a Cr layer, a Mo layer or the like is formed on the gate insulating layer.
